

## Markov and Chebyshev's Inequalities

**Theorem 1** (Markov's Inequality). *Let  $\mathcal{X}$  be a random variable that takes only non-negative values. Then, for every  $a > 0$*

$$P[\mathcal{X} \geq a] \leq \frac{E[\mathcal{X}]}{a}.$$

**Theorem 2** (Chebyshev's Inequality). *If  $\mathcal{X}$  is a random variable with mean  $\mu$  and variance  $\sigma^2$ , then for every  $k > 0$  we have*

$$P[|\mathcal{X} - \mu| \geq k] \leq \frac{\sigma^2}{k^2}.$$

## Confidence Intervals for a Normal

$$\mathcal{X}_1, \mathcal{X}_2, \dots, \mathcal{X}_n \sim \mathcal{N}(\mu, \sigma^2)$$

Parameter	Assumption	Two-sided Interval	Lower Interval	Upper Interval
$\mu$	$\sigma^2$ known	$\left( \bar{\mathcal{X}} - z_{\alpha/2} \frac{\sigma}{\sqrt{n}}, \bar{\mathcal{X}} + z_{\alpha/2} \frac{\sigma}{\sqrt{n}} \right)$	$\left( -\infty, \bar{\mathcal{X}} + z_\alpha \frac{\sigma}{\sqrt{n}} \right)$	$\left( \bar{\mathcal{X}} - z_\alpha \frac{\sigma}{\sqrt{n}}, +\infty \right)$
$\mu$	$\sigma^2$ unknown	$\left( \bar{\mathcal{X}} - t_{\alpha/2, n-1} \frac{S}{\sqrt{n}}, \bar{\mathcal{X}} + t_{\alpha/2, n-1} \frac{S}{\sqrt{n}} \right)$	$\left( -\infty, \bar{\mathcal{X}} + t_{\alpha, n-1} \frac{S}{\sqrt{n}} \right)$	$\left( \bar{\mathcal{X}} - t_{\alpha, n-1} \frac{S}{\sqrt{n}}, +\infty \right)$

## Hypothesis Testing for a Normal

Hypothesis ( $H_0$ )	Assumption	Test Statistic ( $v$ )	Rejection Bound
$\mu = \mu_0$	$\sigma^2$ known	$\frac{\sqrt{n}}{\sigma}  \bar{X} - \mu_0 $	$> z_{\alpha/2}$
$\mu \leq \mu_0$	$\sigma^2$ known	$\frac{\sqrt{n}}{\sigma} (\bar{X} - \mu_0)$	$> z_\alpha$
$\mu \geq \mu_0$	$\sigma^2$ known	$\frac{\sqrt{n}}{\sigma} (\mu_0 - \bar{X})$	$> z_\alpha$
$\mu = \mu_0$	$\sigma^2$ unknown	$\frac{\sqrt{n}}{S}  \bar{X} - \mu_0 $	$> t_{\alpha/2, n-1}$

The p-value is the minimum significance level at which the hypothesis will be rejected.
