BASICS

Definition:

Avalanche = a rapidly moving snow mass
with volume $> 100 \text{ m}^3$ and length $\geq 50 \text{ m}$ (from EAWS glossary)

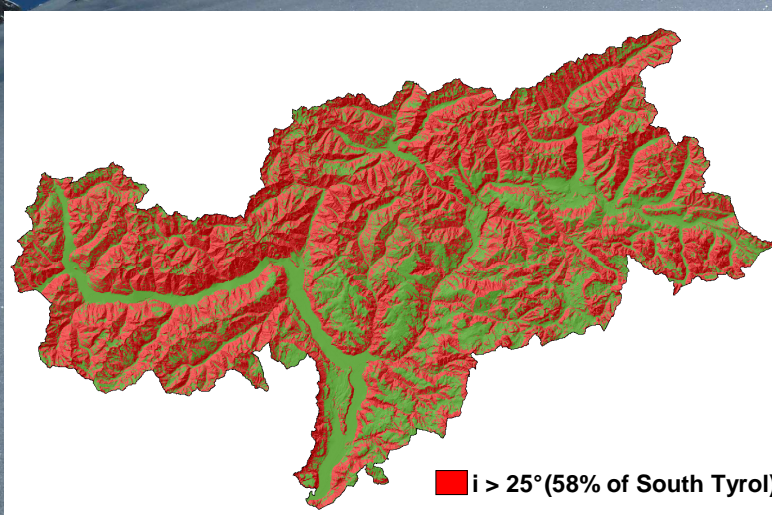

AUTONOME PROVINZ BOZEN - SÜDTIROL
Rudi Nadalet – snow & avalanches

BASICS

Winter snowpack evolution

Figure 1.1: (a) Typical hexagonal snow flake, 1 mm in diameter. (b) Small rounded grains, 0.25-0.5 mm. (c) Depth hoar, 1-2 mm, (Pictures: archive SLF).

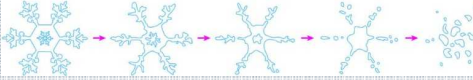

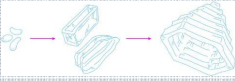

The appearance of snow lying on the ground is completely different from the well known hexagonal shape of a snow flake.

BASICS

Winter snowpack evolution

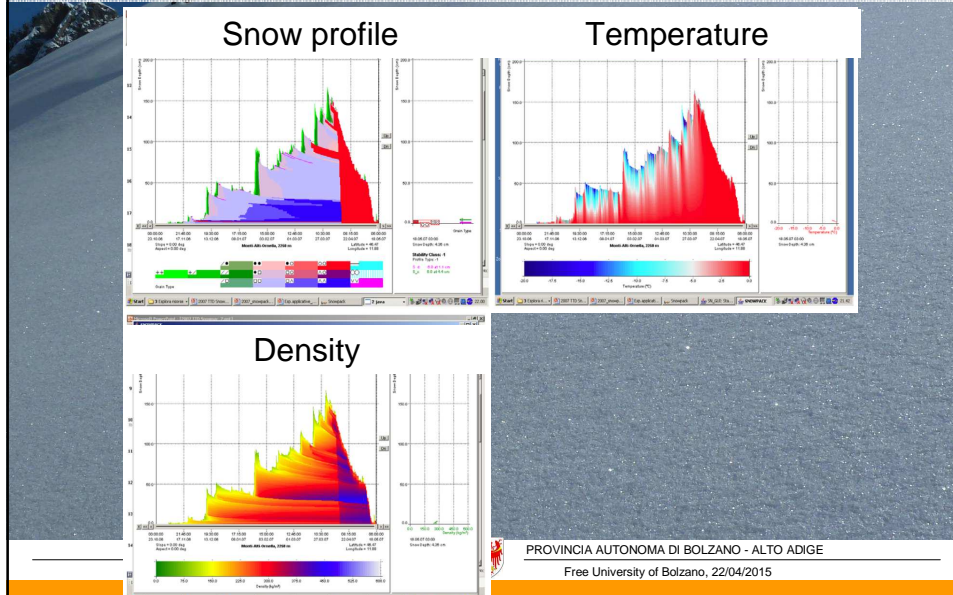

Metamorphism changes the shape and the size of the grains.

Metamorphism processes:

- Destructive metamorphism → 
- Constructive metamorphism → 
- Melt metamorphism → 

BASICS

Winter snowpack evolution

BASICS

Mechanical properties of snow

Table 1.1: Snow compared to other porous materials. Data from Gibson and Ashby (1997).

Material	Density ρ (kg/m ³)	Relative density ρ/ρ_{solid}	Porosity	Tensile strength σ_c (kPa)
Snow	50–550	0.05–0.60	40%–95%	0.5–200
Wood	200–750	0.13–0.50	50%–87%	70'000–100'000

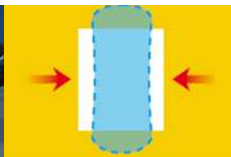

Firn 600-830

Pure ice 917

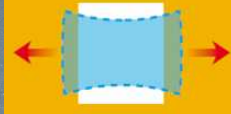

BASICS

Mechanical properties of snow

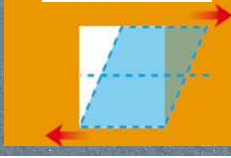

Compressive forces

Tensile forces

Shear forces

- Compressive strenght 
- Tensile strenght = ca. 1/10 of comp.st. 
- Shear strenght $f(\text{layer properties})$

Rudi Nadalet – snow & avalanches

PROVINCIA AUTONOMA DI BOLZANO - ALTO ADIGE
Free University of Bolzano, 22/04/2015

BASICS

Behaviour of snow under loading

For slow loading
snow behaves ductile

e.g.

- successive snowfalls of low intensity
- slight rainfall
- slow warming

Viscoelastic material

Abb. 2

AUTONOME PROVINZ BOZEN - SÜDTIROL
Rudi Nadalet – snow & avalanches

PROVINCIA AUTONOMA DI BOLZANO - ALTO ADIGE
Free University of Bolzano, 22/04/2015

BASICS

Behaviour of snow under loading

For fast loading
snow behaves brittle

e.g.

- skier as an additional load
- explosives

BASICS

Triggering mechanisms

What can happen?

1. Destabilizing forces increase
2. Stabilizing forces decrease
3. Combination of both effects

AUTONOME PROVINZ BOZEN - SÜDTIROL
Rudi Nadalet – snow & avalanches

PROVINCIA AUTONOMA DI BOLZANO - ALTO ADIGE
Free University of Bolzano, 22/04/2015

BASICS

Triggering mechanisms

1. Destabilizing forces increase
e.g. increase of snow weight

AUTONOME PROVINZ BOZEN - SÜDTIROL
Rudi Nadalet – snow & avalanches

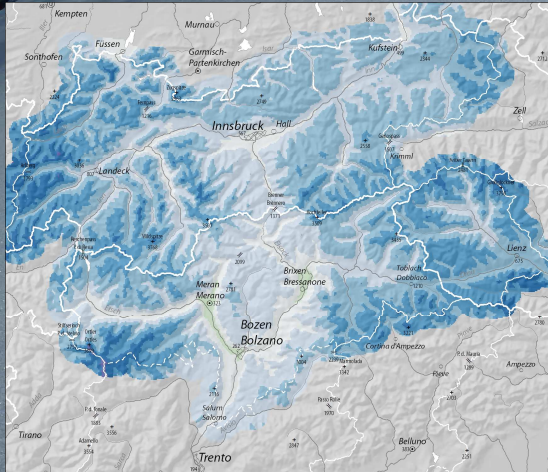

PROVINCIA AUTONOMA DI BOLZANO - ALTO ADIGE
Free University of Bolzano, 22/04/2015

BASICS

Triggering mechanisms

e.g. increase of snow weight

Amount of fresh fallen snow (HN_{3days})

= amount of daily snowfall deposited over 3 days

$$T_R = 30 \text{ Years}$$

CLASSIFICATION

Avalanche size

Size 1: sluff
minimal danger of burying (danger of falling)
snow relocation typically stops before the end of a slope

Size 2: small avalanche
could bury, injure or kill a person
snow avalanche stops typically at the end of a slope

Size 3: medium avalanche
could bury & destroy a car, damage a truck; destroy a small building or break a few trees
avalanche could traverse flat terrain (considerably below 30°) over distances < 50 m

Size 4: large avalanche
could bury and destroy a railway car, large truck, several buildings or a piece of forest
snow avalanche traverses flat terrain (considerably below 30°) over distances > 50 m
and can reach valley ground

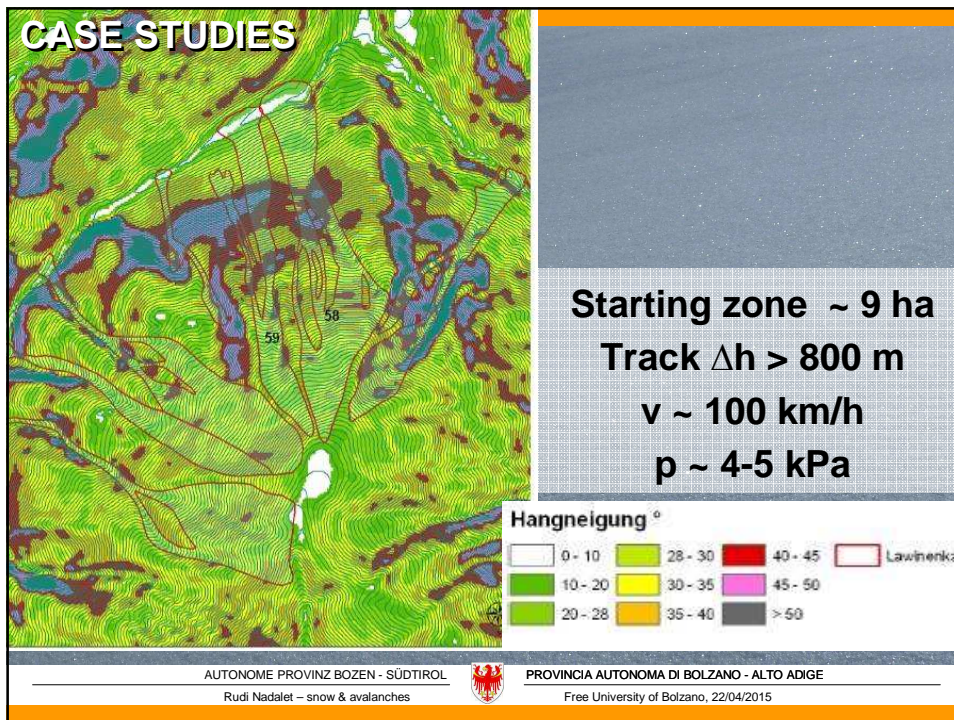

Size 5: very large avalanche
could gouge the landscape; disastrous damage potential
snow avalanche reaches valley ground; largest runout distance known

RISK MITIGATION APPROACH

INTEGRATED RISK MANAGEMENT

	ACTIVE	PASSIVE
TEMPORARY	Local avalanche commissions	Weather forecast Avalanche bulletins
AVALANCHE CONTROL		
PERMANENT	Defence Works	Hazard zones planning

A 2x2 matrix classifying avalanche control measures. The vertical axis represents the duration of the measure (Temporary vs. Permanent), and the horizontal axis represents the nature of the measure (Active vs. Passive). A central horizontal bar labeled "AVALANCHE CONTROL" spans across both Active and Passive measures.
